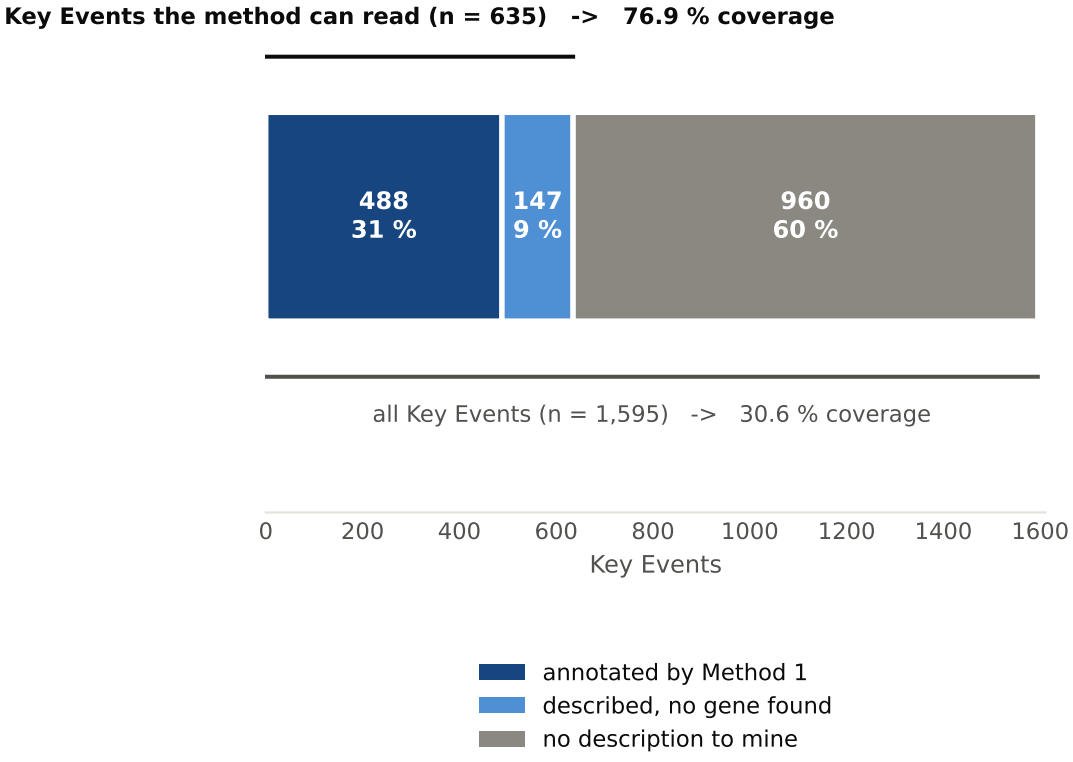
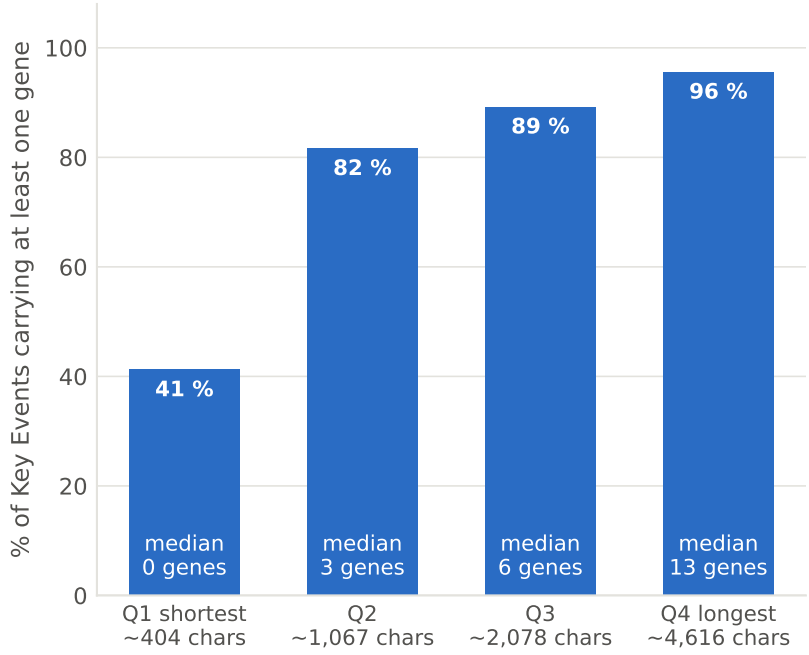
Method 1's ceiling is how much text AOP-Wiki has, not the method

A The same 488 Key Events, two denominators



B Longer descriptions, more genes



AOP-Wiki RDF 97191db (2026-08-01). Every gene-annotated Key Event has a description and no undescribed one carries a gene, so the 960 Key Events without a description are out of scope rather than missed.
B: description length against genes found, Spearman rho = 0.67 (p = 6e-84); quartiles of the 635 described Key Events.
